

COPERNICO TX1750

SINGLE BANKNOTE DETECTION

The **Copernico1750** is the best infrared money detector. Thanks to its new technology it is able to recognize counterfeit banknotes from the genuine ones in a very simple way.

No mechanic and electronic elements avoid the risk of malfunction, most of the time due to electric cards, wheels, straps.

In this way the machine **doesn't need assistance or updates** due to the coming out of new banknotes.

The usage is very simple: just get close the banknote under the display cam and it will show you if it is genuine or not thanks to a wide range of detections:

magnetic ink, UV, infrared, banknote dimension and thickness of banknotes. Check the artwork of the banknote showed in the display to verify the banknote.

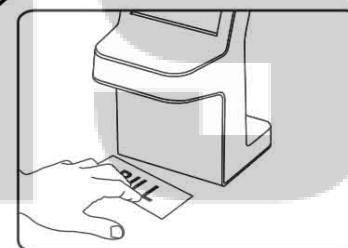

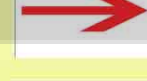

The advantage of this detector is its special control of the banknotes ink (the ink is the main feature of banknotes because it is impossible to counterfeit)

The detector is 100% certified by the European Central Bank.
